Firstly, Download and install Grfx Fix Crack After that open the crack folder Open crack folder and Copy the folder in destination folder After copying paste crack file into the folder Now open the folder and Run the Crack File Enjoy! Also Download: Day CX CrackQ: How can I cut off the last 10 bits (characters) of a hex string in Ruby? I am writing a small ruby script to parse out bits of a video file. For example, a video is 24 frames long. The video is 24 px tall and 24 px wide. The hex strings below are all 24 characters long and represent the bits of the video. For example, the first two hex strings represent the first 10 bits of the video. 2110 2020 5200 8100 I am using Ruby 1.9.2. I have tried using regular expressions, but for some reason it keeps adding in a bunch of weird characters before and after the hex string. For example: video_file = "21102020520008100" puts video_file.scan(/[^\d]{2}/).join puts video_file.scan(/[^\d]{2}/).join.length outputs: 21102020520008100 8 I would like to be able to use regular expressions to parse out only the hex strings and not anything else that might be left. A: You need to escape the d (\d) 82157476af
